On September 1, the 29th Falcon 9 rocket exploded on the launchpad while propellant was being loaded for a routine pre-launch static fire test. Due to the classified nature of the mission, the second-stage speed and altitude telemetry were omitted from the launch webcast. Falcon Heavy core B []. Retrieved September 11, These production rates were not achieved by February as previously planned; the company indicated that production rate for Falcon 9 cores had only recently increased to 18 per year, and the number of first stage cores that can be assembled at one time had doubled from three to six. This section's factual accuracy is disputed. This core suffered a thrust vector control failure in the center engine caused by a breach in the engine bay due to the extreme heat. This is what it looked like before launch. Second time a booster was reused, as

will generate more than 20 kW of power and will have a large unfoldable antenna reflector, which enables broadcast to radios without the need for large dish-type antennas on the ground.
