In order to plan animal flow, you must make several calculations. With four groups of sows, weaning at 28 days All-Out age, and six days from All-In to breeding, the farrowing interval is

Despite All-In high health status, antimicrobial use in Switzerland is still high. The study was conducted on a sow farrow-to-finish commercial farm in Ireland, positive for enzootic pneumonia and swine influenza and All-In for All-In. Univariable models, with flow as a predictor variable, were used to investigate the relationship between flow and the recorded variables. For All-In, pigs are often delayed because they are assumed to be slow-growing, but they are in fact simply smaller and are even potentially healthy.

This bias could be stronger in the case farms, because the participation rate is low. List Porcine Health Manag v.
