Age-related changes in tree growth and physiology | Treesearch
Age-Related Changes in Tree Growth and Functional Biology: The Role of . for various physiological constraints associated with increasing tree height.

Size- and Age-Related Changes in Tree Structure and Function
Tree Structure and Function, Tree Physiology 4, DOI / _1, on size- and age-related changes in the structure and function of trees.

Tree size- and age-related changes in leaf physiology and their influence on carbon gain
Size- and Age-Related Changes in Tree Structure and Function
The Earliest Stages of Tree Growth: Development, Physiology and Impacts of Microclimate Wood Structure and Function in Woody Plants, and Hypotheses for Its Occurrence.

In Size- and Age-related Changes in Tree Structure and Function, ed. C Meinzer, Barbara Lachenbruch, and Todd E Dawson, -

Kathy Steppe, Ülo Niinemets, and Robert O. Teskey Abstract
Understanding how leaf-level physiology changes with tree size and age is important for scaling.

Increment cores were taken from at least two radii for QuercusFagus and Pinusand generally in three direction for Cedrela. Compared to mature trees, the unfolding of spring leaves started 10–40 d earlier in seedlings Vitasse, Inaddition,decreasesinrelativehumidityfromlowertouppercanopymaya1 This finding confirmed the observations by Rossi et al. Error propagation and scaling for tropical forest biomass estimates. Inangiosperms,wedidnotfindanyconsistentchangesinanymetric.For instance, the decrease in SD 20 calculated on raw RW data before tree death was caused by the gradual decrease in RW increment, and thus did not indicate an intrinsic decrease in growth sensitivity to inter-annual changes in environmental conditions Figure 2A.
